

M09 MODULE TEST - BUSINESS ANALYSIS TRANSFER CHECK

RC2 | Non-gating | Fresh ServicePulse mini-case | IBA1-IBA11 coverage

Status: non-gating transfer diagnostic. It does not add a prerequisite and does not change IBA1-IBA11 -> Gate A.

Fresh case - ServicePulse support operations

The Operations Head asks: "SLA performance is slipping and escalations feel high. Tell me where to run a four-week intervention first; do not launch a company-wide program." Finance adds: "Do not recommend a fix that simply increases handling time everywhere."

Region	Tickets	Within SLA	Escalations	Avg handle min	Satisfaction
North	80	68	8	11	4.4
South	120	72	24	17	3.6
East	50	45	4	10	4.5
West	150	90	30	18	3.5

Attempt conditions

- Save a genuine first attempt before opening the protected review. No Gate/review solutions or AI-generated solving during the first attempt.
- Tool complexity is not graded. A calculator/spreadsheet may be used, but every material result needs definition, grain, validation and decision relevance.
- Do not average regional rates unless weighting is mathematically justified. Do not turn association into causal proof.

Part A - Decision frame and KPI contract (4 points)

- Rewrite the request as: decision to support, analytical question, scope, comparison/target, Definition of Done and two open assumptions.
- Define SLA rate and escalation rate with numerator, denominator, grain and exclusions. State who owns each definition.

Part B - Prioritized diagnosis (5 points)

- Compute overall SLA rate and escalation rate from numerators/denominators, not by averaging regional percentages.
- Compute each region's SLA and escalation rates. Identify where the problem is concentrated using both performance and volume.
- Perform one independent reconciliation and state what result it validates.

Part C - Insight and causal boundary (4 points)

- Write three observation -> insight -> implication chains with versus-what, magnitude, scope and decision use.
- The low-SLA regions also have longer average handle time. Write one safe association statement, two plausible alternative explanations and the stronger evidence needed before claiming handle time caused SLA failure.

Part D - Executable recommendation (3 points)

- Recommend one four-week intervention with owner, first action, scope/timing, success metric, risk/dependency and explicit stop/continue rule.
- Write expected benefit as a hypothesis rather than a guaranteed outcome.

Part E - Communication and defense (4 points)

- Write a 100-130 word executive memo: decision first, 2-3 strongest evidence points, limitation and next measurement.
- Create a three-slide message-headline plan: problem/decision -> concentrated evidence -> recommendation/measurement.
- Answer this stakeholder challenge in 3-5 sentences: "West has more tickets, so of course it has more misses. Why are you targeting it?"

Score interpretation

16-20: strong transfer. **12-15:** targeted repair only. **0-11:** return to named weak competencies. This diagnostic never changes Gate eligibility.
