

COURSE 1 - M11 | JOB READINESS GATE A PROTECTED REVIEW

ParcelFlow | Junior Operations Data Analyst | RC2 deep diagnostic | Technical + hiring evidence | Gate state unchanged

Protected review: open only after the genuine Gate attempt and evidence are saved. Use this document to diagnose the attempt, not to manufacture first-attempt evidence.

Layer 1 - protected technical controls | Gate A

Control	Expected / diagnostic meaning
Delivered denominator	32
On-time numerator	12
On-time rate	$12 / 32 = 37.50\%$
Delivered shipment value	109,118.35

Interpretation contract

- **Grain first:** name the eligible row set before computing a rate or average.
- **Independent validation:** verify at least one material result by a second method (for example, formula + pivot/filter/count, or code/query + manual control).
- **Do not memorize controls:** a matching number without denominator, method and evidence does not pass C4.
- Wrong denominator such as all 42 shipments, an uncorrected material arithmetic error, or "East causes delays" without evidence blocks C4.

Why this is interview evidence

A junior analyst is not being tested only on arithmetic. The reviewer should be able to see the business definition, the calculation path, the check, the limitation and the decision implication.

Layer 2 - deeper diagnostic, not a “winner” table

Region	Delivered n	On-time	Rate	Avg actual-planned gap	Delivered value
East	6	1	16.67%	+15.00 h	15,876.66
North	11	5	45.45%	+7.36 h	43,616.61
South	10	5	50.00%	+4.00 h	36,181.42
West	5	1	20.00%	+14.40 h	13,443.66

Expected reasoning

- East has the lowest observed on-time rate (16.67%) and the largest average delay gap (+15 h), so it is a defensible first investigation if rate/severity is the priority.
- North has the most late Delivered rows in absolute count (6 of 11). If volume of failures is the operational priority, that can change the investigation order.
- A strong answer names the prioritization metric, acknowledges sample size/volume, and does not claim that region itself caused lateness.
- Before causal language, seek shipment distance/route, carrier, service level, dispatch time, weather/traffic, product/weight, hub workload and comparable-period controls.

Causal boundary

Segment differences are evidence for **where to investigate**, not proof of **why the difference exists**. The learner must distinguish observed association from a causal mechanism and name additional evidence needed before changing the claim.

Changed technical retry standard

After review, close this document and solve a changed denominator/segment case without copying the protected values. Save the changed retry separately from the original attempt.

Layer 3 - eight critical hiring competencies | pass-all rubric

ID	Competency	PASS evidence	Targeted repair
C1	Portfolio proof	Working links; strongest relevant project; reproducible evidence; project is labelled as a project, not employment.	PCH1-PCH6
C2	Resume/profile truthfulness	Every claim is accurate, current and defensible; no invented employer/client/certification/offer/salary/metric.	PCH7-PCH8
C3	Project walkthrough	Explains business question, grain, quality issue, method, validation, limitation and decision in own words.	PCH10
C4	Technical case	Correct denominator/grain, reproducible calculation, independent check, uncertainty/causal boundary.	PCH11 + named technical module
C5	Behavioral communication	Specific truthful situation/action/result/learning; project examples remain labelled projects.	PCH12
C6	Professional questions	Two role/company/team questions that show preparation and help evaluate the actual job.	PCH12-PCH13
C7	Offer/salary/logistics	States known vs unknown; researches actual role/company/location; never invents competing offers or salary facts.	PCH13
C8	Role-family readiness	Evidence fits the target analyst role; gaps and next actions are explicit rather than hidden.	PCH9 + PCH14

Critical truth and public-evidence guardrails

- A course project, volunteer exercise, self-study capstone or simulated business case must be labelled truthfully. Do not rewrite it as paid employment, a client engagement or production ownership.
- Do not invent certifications, employers, referrals, interview stages, job offers, competing offers, current salary, expected company range, project metrics or recruiter conversations.
- Do not publish passwords, API keys, access tokens, private personal data, confidential company data or unapproved proprietary data in a portfolio repository.
- A technical or quantified claim must have a reproducible evidence path that the learner can explain without a memorized script.

Final Gate decision

PASS only when C1-C8 are all PASS and no critical failure is present. No averaging. A clean PASS ends M11. Gate B is allowed only after failed A + saved attempt + Review A + targeted repair + explicit assignment.

Evidence to retain

- Saved Gate workbook attempt and changed retry (if assigned).
- Current resume/profile/repository links used in the Gate; screenshots or exported evidence where appropriate.
- Independent technical validation and a short explanation of denominator/grain, limitation and causal boundary.
- Mock-interview evidence: 60-second intro, 3-minute own-project walkthrough, behavioral answer, two interviewer questions, salary/logistics response.
- Reviewer decision showing C1-C8 individually PASS/REPAIR and the exact targeted repair route.
