

Gate C review - open only after saved attempt

1. Pass logic

This Gate is competency-based. A plausible workbook is not enough. Formula/reference behavior, row integrity, Table creation, summaries, chart, validation and explain-back must all be independently correct.

2. Expected formula structure

Use row input cell references for the base calculation. Use one fixed shared setting cell with an absolute reference for Discount / Service Charge / Tax. Final value must depend on the intermediate calculation rather than typing an answer.

3. Expected summaries

Final-column controls: SUM = 71,769.60; AVERAGE = 4,221.74; MIN = 134.40; MAX = 12,320.00; COUNT = 17. Top filtered ID = C003 with final value 12,320.00.

4. Critical validation

Manually recompute the first data row. Compare record count before and after clearing the filter. Check that the Table name is the exact assigned name. Confirm chart source is the first eight IDs vs final values.

Critical-failure review

- Hard-coded numeric answers instead of formulas from input cells.
- Shared rate changes as the formula is filled down because the reference was not fixed.
- Only one column was sorted and record relationships were corrupted.
- The range is merely styled, but not a real Excel Table with the assigned name.
- Filter was left active / row count not restored and the learner treats hidden rows as deleted.
- Summary formulas use the wrong range or omit/include unintended rows.
- Chart uses wrong labels/values or a misleading structure.
- No independent check, or explain-back cannot describe what the workbook is doing.
