PROTECTED MATERIAL

This review contains strong-answer anchors and diagnostic guidance. Close it before doing the changed fresh retry.

How to use the review

- 1 Place your saved BrightBasket attempt beside this review.
- 2 For each competency, mark PASS / REPAIR NEEDED / NOT ATTEMPTED.
- 3 Read only the section needed to understand the weakness.
- 4 Use the Targeted Repair Cards only for the named weak competency.
- 5 Close all protected material and solve the changed fresh retry.

Strong-work diagnostic matrix

F1 Decision support	Decision is explicit; analysis supports rather than pretends to own the business action.	Tool-first answer; recommendation presented without evidence/decision context.
F2 Framing	Decision, comparison, scope, time and meaning are clarified; bounded question is non-causal.	Question invents a cause or cannot guide a decision.
F3 Metric	Metric meaning/rule is reproducible; rate denominator is explicit; unresolved business rules remain visible.	Undefined/wrong denominator; target treated as the metric; invented eligibility rule hidden as fact.
F4 Grain + data	Source/result grains are explicit; repeated IDs interpreted at correct grain; minimum data linked to question.	Expected event repetition deleted/called duplicate; result grain missing; key assumption wrong.
F5 Quality	Five scenario-specific checks with business impact/next action.	Generic "check nulls" list; auto-delete/fill without investigation; uniqueness tested at wrong grain.
F6 Trust + done	Validation logic, comparable reconciliation, sanity check, assumptions/limitations, testable DoD and Ready/Not Ready.	Forcing non-comparable totals to match; untestable DoD; unsupported causal claim; missing limitation.

BrightBasket strong-answer anchors

Framing: A defensible bounded question could ask how pickup wait differs by store and time period for an agreed eligible population, after the business defines what "wait" means.

Metric: If the team wants a threshold-based late-pickup rate, the threshold and eligible population must be approved first. If it wants elapsed wait, the start/end timestamps must be defined. Do not invent either.

Grain: pickup_orders is intended one row per OrderID. order_events is many rows per OrderID. Repeated OrderID in order_events is expected event-history grain, not automatically duplicate orders.

Quality: Examples include required ReadyAt/PickupAt completeness for eligible completed orders; OrderID uniqueness in pickup_orders; PickupAt >= ReadyAt when both are present; consistent Status/OrderChannel labels; LastUpdatedAt covering the requested period.

Validation: Check eligible row counts, missing timestamp rates and plausible wait values. The official completed-pickup counts may reconcile only if your completion definition/store/week basis matches; they do not validate the wait metric itself.

Limitation: Event history may describe what happened but does not by itself prove why wait increased.

Definition of Done: Approved wait/eligibility rule, traceable eligible counts, passed/understood quality checks, validated metric, documented exceptions and a result at the agreed store/time grain.

CHANGED FRESH RETRY	Close this review. Use the Fresh Retry case in the Targeted Repair Cards or a Mentor-assigned changed case. The wording above must not be copied into the retry.
