

Targeted Repair Cards

Use only after saved evidence identifies the weak competency

QUESTION

MEASURE

GRAIN

TRUST

EVIDENCE

**PROTECTED
MATERIAL**

Do not read every card as study notes. Open only the competency assigned for repair, then close this file and solve the fresh retry.

F2 - Framing

Changed micro-case: Returns are high.

- Who needs the answer and what decision?
- Write one useful question for Decision / Comparison / Scope / Time / Meaning.
- Write one bounded question that does not assume why returns are high.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

F3 - Metric

Changed micro-case: Refund performance needs attention.

- Define Refund Rate using denominator option A: all completed orders.
- Define it using denominator option B: all returned/refund-eligible orders.
- Explain how the two definitions answer different questions and which business rule must be approved.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

F4 - Grain

Changed micro-case: An order can have many refund events.

- State grain of orders and refund_events.
- Explain why OrderID can repeat in refund_events legitimately.
- For a monthly region refund analysis, state result grain and minimum key/date/amount/status fields.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

F5 - Quality

Changed micro-case: Subscription renewals look unusual.

- Write one field-specific completeness check.
- Write uniqueness at the intended subscription-cycle grain.
- Write one validity, consistency and timeliness check.
- For each, state impact and investigation/next action.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

F6 - Validation

Changed micro-case: Finance total differs from your operational total, but Finance uses invoice month while your analysis uses service-completion month.

- Explain why the totals are not directly comparable yet.
- Design one internal validation check.
- Describe how you would create a comparable reconciliation.
- Write a testable Definition of Done and one visible limitation.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

F1 - Decision support

Changed micro-case: Store conversion is down.

- Write the business decision before naming a tool.
- Map the concern through the analyst workflow.
- State one sentence the evidence could support and one claim it could not support without more data.

Repair pass: answer from a blank page, validate against the lesson principle, then explain it without this card open. The next Gate is not unlocked by reading this card; it is unlocked only by the assigned route after saved repair evidence.

Fresh retry case - CareConnect Calls

Concern: "Call resolution seems worse. Find the support teams and weeks that need attention."

Schema card: support_calls is one intended row per CallID; call_events contains many events per CallID. No approved definition exists for "resolved on first contact" when calls transfer or reopen. An official staffing report uses payroll week, not call-close week.

Build a short four-section Analyst Brief from scratch. Close all repair/review material first. Save the retry separately from the failed attempt.
