PROTECTED MATERIAL

Open only after the Gate B attempt is saved. This is diagnostic material, not a study-before-Gate answer sheet. Close it before any fresh retry.

Gate decision rule

PASS requires all six critical competencies to pass and no critical-failure condition. There is no percentage average. One critical failure is enough to require targeted repair.

Scenario-specific critical point

The business has not defined grace minutes, whether cancelled/failed deliveries are eligible, or which timestamp governs cross-midnight cases. There is no reliable root-cause field for traffic, staffing or customer unavailability.

Competency anchors

C1	Names decision/stakeholder; asks only useful clarification; bounded question does not assume cause.	F2
C2	Metric is defined in business terms. Any rate states numerator + eligible denominator or explicitly marks the missing rule as unresolved.	F3
C3	States both source grains and result grain; recognizes expected many-row history; names only data/rules needed for the question.	F4
C4	Five checks use actual scenario fields/rules and explain impact/next action.	F5
C5	Validation tests internal logic; reconciliation is comparable or explicitly not comparable; DoD is testable; assumptions/limitations visible.	F6
C6	Interpretation stays within supplied evidence; no unsupported root-cause claim; analysis supports the decision.	F1

Scenario answer anchors

- On-time/late requires an approved promise comparison and grace/eligibility rule; do not invent grace minutes.
- delivery_summary is one intended row per DeliveryID; delivery_events is many rows per DeliveryID.
- A cross-midnight delivery needs an agreed timestamp/time-zone/business-day rule before classification.
- Completed-delivery counts can reconcile only matching hub/week/status populations; they do not prove an on-time rate.
- No reliable traffic/staffing/customer-unavailability root-cause field is supplied.

Critical failures

- Undefined/wrong eligible denominator presented as settled.
- Invented business rule hidden as fact.
- Expected many-row event history treated as duplicates solely because the parent ID repeats.
- Generic quality list disconnected from scenario fields or uniqueness checked at the wrong grain.
- Non-comparable official total used as proof of the target metric.
- Unsupported causal claim.
- Definition of Done says only "looks correct" or otherwise cannot be tested.

REPAIR ROUTE

Targeted F1-F6 repair on the exact failed competency; save changed repair evidence; close this review; then follow the explicitly assigned next Gate route.
