

Gate A - RepairHub Jobs

1. Protected first attempt

Use C1_M05_POWERBI_MODELING_GATE_A_DATA_RC1.xlsx. Learner book, practice review, Gate review, tutorials and AI solving are closed. Create a fresh PBIX and save evidence before opening review.

2. Required build

Import through Transform Data. Profile all tables. Preserve raw source. Justify transformations. State grain. Prove intended one-side key uniqueness. Build a clear star model with 1:* single-direction dimension-to-fact relationships. Audit Date and connect it to the fact date.

3. Required trust checks

Save source/prepared fact rows; exact-duplicate result; dimension uniqueness after justified trim; unmatched key counts; invalid date/discount counts; one gross quantity x rate control; and a temporary filter-propagation test.

4. Critical failures

Arbitrary raw edits; deleting unexplained rows; hiding invalid/unmatched keys; forcing many-to-many/bidirectional filtering to make warnings disappear; wrong Date relationship/coverage; no control-total reconciliation; or inability to explain the model can block a pass.

Submission and exact next route

5. Evidence to save

PBIX filename/version; Power Query/Model screenshots; grain table; relationship list; source/prepared row counts; key/unmatched/invalid controls; gross control total; temporary dimension-filter proof; unresolved issue log; confidence 1-5; 90-second explain-back.

6. Explain-back

Explain: fact grain; each dimension grain; why the one side is valid; why single-direction filter flow is used; one unresolved quality issue; one independent control total; and what would make you stop trusting the model.

7. Exact next route

A clean pass ends M05. Gate B only after failed A + Review A + repair + explicit assignment. If remediation is needed, keep the original attempt, open the matching Gate review only after saving it, repair the named competency, close review and complete changed evidence.
