

M06 internal-QA evidence

Clean DAX/reporting regeneration checkpoint. No Course 1 learner-release claim is made.

Canonical lessons	10/10 PBD1-PBD10 + M-PBIR
Learner book	41 pages; exact 16-stage contract on every lesson
Contents / routes	11 internal destinations: PBD1-PBD10 + M-PBIR
Learner source links	13 current learner-facing links
DAX teaching reference	Explicit measures/context/target/time patterns; no Gate answers
Practice source	RetailPulse regenerated; protected metric parity exact
Gate source data	FitLife / QuickServe / CarePoint all recompute exactly
Practice/review/project	11-page guide; 11-page review; 4-page M-PBIR project
Gate controls	3-page guide + separate 2-page protected review per Gate
Workbook integrity	Practice + A/B/C + mastery XLSX CRC/error scans pass
Static QA	185/185 PASS
PDF preflight	86 pages; blank/bounds checks pass

Defects caught and corrected

Official runtime references exposed

The learner book exposes Microsoft time-intelligence, refresh and RLS references at the lessons where current product behavior matters rather than keeping them hidden only in a registry.

Protected Gate repair-state omission fixed

The first regenerated targeted-repair cards did not repeat the B/C explicit-assignment state rule. All repair cards now state: A clean pass ends; B/C require prior failure + saved attempt + protected review + repair + explicit assignment; no automatic progression.

Gate B QA false positive resolved

The Gate B guide already contained the correct state rule, but PDF line wrapping split the sentence. QA now normalizes PDF whitespace rather than treating a visual line break as a missing instruction.

Protected metrics independently recomputed

RetailPulse practice and all three Gate workbooks match their protected expected metrics from regenerated XLSX bytes: counts, net values, costs/profit/margin, rates, Jan/Dec/prior-year controls, targets and top entities.

Target/security boundaries strengthened

Monthly targets cannot be invented at daily grain. Slicers/page hiding are explicitly not RLS. Publish/scheduled-refresh/workspace behavior must be evidenced or labelled unavailable.

Runtime boundary and remaining Course 1 work

Power BI Desktop/runtime

Still required before learner release: execute DAX/context behavior, target/time calculations, interactions/drillthrough/tooltips, Desktop refresh and PBIX save/reopen.

Power BI service

Publish, scheduled refresh, role membership and sharing must be tested only when a compatible tenant/workspace/license is available; otherwise the course records the limitation rather than inventing a pass.

Mentor synchronization

Pending by design until regenerated filenames, book pages, project routes and Gate paths are stable across Course 1.

Remaining modules

M07-M11 still require clean beginner-first regeneration and module-level QA.

M06 status

Static internal-QA module candidate PASS only. Not FINAL, not CONTENT FREEZE, and not a whole-course release.
