

M07 internal-QA evidence

Clean Python-for-Analysts regeneration checkpoint. No Course 1 release claim is made.

Canonical lessons	11/11 PY0-PY10 + M-PY
Learner book	44 pages; exact 16-stage contract on every lesson
Canonical practice notebook	50 cells; direct PY0-PY10 guided + changed mapping
Clean-kernel execution	Practice notebook + Gate A/B/C PASS
Source fixture parity	Practice_Data + Gate_Data exact baseline byte match
Protected metrics	Practice + A/B/C independently recomputed and exact
Learner source links	14 current/curated links
Practice review	13 pages; PY0-PY10 + M-PY; post-attempt only
Gate assessment	3 distinct protected notebooks + 3 protected reviews
PDF preflight	71 pages; blank/bounds checks pass
Static/runtime QA	171/171 PASS

Forensic defect repaired

Practice notebook lesson drift

The inherited notebook became offset after PY2: later canonical skills were attached to the wrong P-PY headings. RC1 rebuilds the notebook from the canonical lesson registry, so every PY0-PY10 lesson owns its own guided and fresh task.

Schema guess stopped and corrected

During independent recomputation, QA stopped when a guessed product column name did not exist. The actual fixture headers were inspected and calculations were rebuilt from the real schema rather than forcing a guessed transformation.

Practice controls

The strict practice analysis removes the duplicate order-line ID pair and invalid-discount row while tracking other quality issues explicitly. Recomputed net sales, orders, region concentration, refunds and net-after-refund values match protected controls.

Gate controls

HelpDesk validates duplicate/impossible timestamps and four-hour response SLA; Delivery validates dates/cost, on-time rate, lateness and cost/km; Subscription normalizes status case, validates support/signup and plan enrichment. All protected anchors match.

Runtime proof

The learner practice notebook and all three Gate notebooks execute top-to-bottom from a fresh Python kernel. This verifies notebook structure/relative-path setup without pre-solving the learner's analysis cells.

Release boundary and remaining Course 1 work

Learner-device Jupyter

The QA environment proves the supplied notebooks start cleanly, but the final Course 1 device simulation must still verify the learner's Windows/Jupyter install, file placement and save/reopen workflow.

Mentor synchronization

Pending until all regenerated module filenames, learner-book pages, notebooks/projects and Gate routes are stable.

Remaining modules

M08-M11 still require clean beginner-first regeneration and module QA.

M07 status

Static/runtime internal-QA module candidate PASS only. It is deliberately not labelled FINAL, CONTENT FREEZE or whole-course release.
