

M08 internal-QA evidence

Integrated QA

146/146 PASS.

Learner book

38 pages; all 9 lessons use the exact 16-stage beginner-first teaching sequence; 10 internal TOC routes.

Workbook architecture

15-sheet practice workbook with direct STAT1-STAT9 mapping plus M-STAT, experiment data, visual explorer, evidence log and mastery tracker.

Runtime/metrics

Visual simulation notebook clean-kernel PASS. Practice controls and Gate A/B/C protected experiment controls independently recompute exactly.

PDF visual QA

60 learner/review/repair pages rendered and inspected; no blank or out-of-bounds text blocks detected.

Workbook visual QA

Representative sheets rendered. STAT4/STAT5 blank-render defect was traced to corrupted worksheet objects, recreated, rerendered and verified.

Gate protection

A terminal clean pass; B/C only after prior failure + saved attempt + review + repair + explicit assignment.

Defects caught before promotion

Canonical lesson drift

Inherited practice structure merged/shifted STAT4-STAT9. RC1 restores one direct sheet per canonical lesson.

Correlation registry drift

Inherited protected registry labelled the Pearson-correlation control under old STAT6 numbering. RC1 documents and maps that same control to canonical STAT8.

STAT4/STAT5 rendering

Two worksheet objects contained valid values/styles but rendered blank inside the workbook. They were deleted/recreated as fresh worksheet objects without changing the lesson numbers/data.

Gate contrast

Protected-attempt heading contrast was repaired to the teal/white Option B standard.

QA scanner wording

P-value and significance checks now distinguish prohibited-example warnings from endorsed teaching statements and normalize PDF whitespace.

Release boundary

M08 status

Internal-QA module candidate PASS. This is not a whole-course learner release.

Remaining course work

M09-M11 still require clean rebuild/QA; Mentor synchronization waits for stable final routes.

End-to-end environment QA

Whole-course learner-device/open/save/review/Gate/Mentor simulation remains a later release gate.
